PRIMARY NUMBER WORK

NOTATION AND NUMERATION OF NUMBERS, 1 TO 100

Counting up to 10.

Count the number of windows in the school.

Count the number of seats in the first row.

Count the number of boys in the class.

Count the number of girls in the class.

Count the number of pictures on the wall.

Take the pupils to the window and have them count the number of buildings they see.

The teacher should give the pupils practice in counting objects up to 10. Care should be taken that the pupils repeat the name of each number correctly.

NOTE. Each pupil should have a number box with objects which are easily handled for counting. Such objects as beans, spools, blocks, cones, almonds, etc., make good material.

How many birds are on the fence?

How many cows do you see in the field?

How many boys and girls are listening to the story?

How many apples are in the dish?

How many trees do you see along the road?

How many sheep are in the field?

How many horses is this man driving?

How many little chickens has this mother hen?

Reading and writing the numbers up to 10.

Have the pupils pick out from their number boxes, *one* spool; *one* block; *one* button; etc.

Give the pupils the written name and figure: *One, 1.*

Have the pupils pick out *two* spools; *two* beans; *two* rose-hips, etc.

Give the written name and figure: *Two, 2.*

Making a similar use of the objects, teach the names and figures:

Three, 3

Four, 4

Five, 5

Six, 6

Seven, 7

Eight, 8

Nine, 9

Ten, 10

1. Write on the blackboard the names of the different numbers up to ten and have the pupils count out objects from their number boxes to represent them.

2. Write on the blackboard the figures representing different numbers up to ten and have the pupils count out objects to represent them.

EXERCISE

1. Count out 3 beans; 4 spools; 5 pebbles; 8 blocks; 6 rose-hips; 9 cones; 7 nails; 10 clothes pins.

2. Count out *seven* spools; *five* beans; *eight* blocks; *six* nails; *nine* rose-hips; *three* pebbles; *four* clothes pins; *ten* cones.

3. Give the name for each of the following: 3, 5, 8, 7, 6, 10, 4, 9, 2.

4. Write the figure for each of the following: two, seven, one, five, ten, nine, four, six, eight, three.

5. Write the numbers with the names and figures on the blackboard and keep these for reference. Have individual pupils read aloud from the blackboard:

one	two	three	four	five
1	2	3	4	5
six	seven	eight	nine	ten
6	7	8	9	10

SEAT EXERCISE

1. Have the pupils draw pictures showing: 6 tents; 8 apples; 5 boys; 7 chickens; 3 spools, etc.

2. Have the pupils make various objects from plasticine. Choose exercises that will give an opportunity for applying counting in the number space up to 10.

Examples:

Make a mother hen with 7 little chickens.

Make a bird's nest with 6 eggs.

Make 5 little pigs.

3. Have the pupils make designs with colored sticks, the teacher drawing the designs on the blackboard. Have the pupils count the number of sticks used in each design, and have them write down the figures.

The following are a few specimen designs:

STAR

LADDER

HOUSE

Counting up to 25.

Provide each pupil with objects to count out the numbers from 10 to 25. Test each pupil carefully and see that he is able to count accurately any number of objects up to 25.

Reading and writing the numbers up to 25.

As the pupil grasps the numbers from 11 to 25, give the figures which represent these numbers:

11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25

Test the pupils frequently in reading the foregoing numbers at sight. The numbers should be written on the blackboard, or on a chart, and should be used for frequent drills.

EXERCISE

1. Have the pupils take out their number boxes and pick out different numbers, *e.g.* 15, 22, 17, 9, 19, 25, 18, etc.

This exercise should be given daily, until each pupil is able to count accurately any number of objects up to 25.

2. From dictation have the pupils write down the different numbers, giving them in various sequences, *e.g.* 22, 17, 9, 13, 20, 10, 24, 7, 15, 21, etc.

3. Have the pupils copy the numbers from 1 to 25.

Counting up to 50.

Reading and writing the numbers up to 50.

After the pupils know the numbers up to 25, the counting of objects up to 50 should be taken up. The figures representing the numbers from 26 to 50 should be taught.

EXERCISE

1. From the number boxes have the pupils pick out 35, 42, 29, 27, 38, 16 objects.

2. Repeat Example 1, giving a drill on all the numbers up to 50.

Give the following exercises to the pupils:

3. Write the numbers from 20 to 35.

4. Write the numbers from 31 to 50.

5. Write the numbers from 37 to 49.

STUDY OF THE NUMBERS 2 TO 10

Grouping

The purpose of grouping is to enable the pupil to find out the number relations of the various numbers.

The pupil counts out from his number box 2 objects ; these may be alike or may be different objects. He sees that the group *two* is made up of two *ones*. He represents this fact with the objects.

In the same way he proceeds with all the numbers to 10, arranging the various groups so as to show all the number relations contained in them.

This work should be manual and oral. The pupil should be led to discover these relations for himself.

The following are some of the groupings or number relations the pupil can make with *six*:

The pupils should be given frequent practice in grouping objects, so that they may know all of the relations of any number.

EXERCISE

1. Write on the blackboard any number or its name and have the pupils show with objects all the number relations.
2. Arrange any group of objects up to 10 and ask the pupils to tell the number stories represented. Lead the pupil to grasp the group, without counting out the separate objects composing it.

The combinations and separations of the numbers 2 to 10.

After the pupil has studied the number groups and has developed the various number relations from them, he should be given the formal work in number combinations and separations.

The Number 2

Teach:

1 2 Read 1 and 1 are 2.

$\frac{1}{2}$ $\frac{-1}{1}$ Read 2 take away 1 leaves 1.

The pupil should learn both the addition and the subtraction at the same time. Do not treat these as separate processes. Give frequent and thorough drills on these relations.

Oral applications.

MEASURING

The teacher should be provided with a pint and a quart measure. Ask the pupils to fill the quart measure with water, using the pint measure. Reverse the process. Fill the quart measure with water and have the pupils pour it into the pint measure, finding out how many pints are in the quart.

Teach:

In 1 quart there are 2 pints.

The teacher should have the pupils count out 12 pencils, 12 brushes, 12 blocks, 12 cones, etc.

Give the name *dozen*.

Teach:

In 1 dozen there are 12 things.

1 DOZEN

Have the pupils count the number of days in the week and the number of months in the year. Also have each pupil count the number of inches on his foot ruler.

Teach:

In 1 week there are 7 days.

In 1 year there are 12 months.

In 1 foot there are 12 inches.

ONE-HALF AND ONE-QUARTER

Take a square piece of paper and fold it evenly across *once* so that the edges meet. Now unfold the paper. We see that the paper is marked off into 2 parts, and that each part is the same size. The paper is divided into 2 equal parts. We call each of these equal parts *one-half*.

Give the pupils practice in folding squares and circles, so as to develop the idea of dividing any object into 2 equal parts, or taking *one-half* of it.

Take a square piece of paper and fold it evenly across so that the edges meet. Now fold it again so that the sides meet. Now unfold the paper. We see that the paper is marked off into 4 parts, and that each part is the same size. The paper is divided into 4 equal parts. We call each of these equal parts *one-quarter* or *one-fourth*.

Give the pupils practice in folding squares and circles, so as to develop the idea of dividing any object into 4 equal parts, or taking *one-quarter* of it.

TELLING TIME

On clocks and watches letters are often used instead of figures in writing the numbers from 1 to 12.

I is used for 1.

VII is used for 7.

II is used for 2.

VIII is used for 8.

III is used for 3.

IX is used for 9.

IIII is used for 4.

X is used for 10.

V is used for 5.

XI is used for 11.

VI is used for 6.

XII is used for 12.

1. Give the name of each of the following numbers :

V	III	IX	XII	IIII	VIII
II	XI	VI	X	VII	I

NOTE TO THE TEACHER. — The teacher should represent with a piece of cardboard the face of a clock with movable hands.

Read the numbers on the clock face.

Point out 9, 7, 6, 3, 12, 1, 10, 8, 5, 4, 2, and 11.

The long hand on the clock is called the *minute hand*.

The short hand on the clock is called the *hour hand*.

When the minute hand points to XII and the hour hand points to IX, it is 9 o'clock.

When the minute hand points to XII and the hour hand points to VI, it is 6 o'clock.

Illustrate by moving the hour hand : 2 o'clock ; 4 o'clock ; 8 o'clock ; 7 o'clock ; 11 o'clock ; 5 o'clock ; 10 o'clock ; 3 o'clock ; 12 o'clock.

Show the pupils that the minute hand travels all the way round the clock every hour. Then show them that when the minute hand has moved from 12 to 6, the hour hand has moved half a space. The time is half past.

Illustrate with the clock face: half past 9; half past 3; half past 8, etc.

By means of the clock face give the pupils practice in reading the half hour.

If the minute hand travels from XII to III, it has gone one-fourth around the clock. We say that the time is a quarter past.

Illustrate with the clock face: a quarter past 9; a quarter past 12; a quarter past 3, etc.

By means of the clock face give the pupils practice in reading the quarter past.

If the minute hand has travelled from XII to IX, it has to go from IX to XII to complete the hour. That is, it is a quarter to the next hour.

Illustrate with the clock face: a quarter to 8; a quarter to 4; a quarter to 12; a quarter to 9; a quarter to 5; a quarter to 3, etc.

By means of the clock face give the pupils practice in reading the quarter to.

EXERCISE

Using the clock face, show the following times and have the pupils tell the time in each case:

1. Six o'clock; 3 o'clock; 12 o'clock.
2. Half past 7; a quarter past 5; a quarter to 9; half past 8.
3. A quarter to 3; half past 6; 11 o'clock; a quarter past 6; half past 10.

Continue such exercises until the pupils are familiar with reading the time.

EXERCISE

Using a foot ruler, have the pupils do the following:

1. Draw a line 6 inches long.
2. Draw a line 4 inches long.
3. Draw a line 8 inches long.
4. Draw a line 5 inches long.
5. Draw a line 10 inches long.

Cut off a strip of cardboard 1 inch long. With this 1 inch of cardboard as a ruler, have each pupil find:

6. The number of inches in the length of his reader.
7. The number of inches in the length of his pencil.
8. The number of inches in the length of a piece of chalk.
9. The number of inches in the length of his desk.
10. The number of inches in the length of his note-book.

Oral.

11. On Monday Mary's mother bought 4 quarts of milk. If the milkman gave her the milk in pint bottles, how many bottles did she get?

12. Arthur bought the ice cream for a picnic. He bought 3 pints of strawberry ice cream, 3 pints of chocolate ice cream, and 2 pints of vanilla ice cream. How many quarts of ice cream did he buy?

13. Betty began to attend school on the first day of February and attended every day until the last day of June. How many months did she go to school?

14. Jack bought 3 apples, Robert bought 5 apples, and Harold 2 apples. They divided the apples equally among 5 boys. How many apples did each boy receive?

15. Tom sells milk. On Monday he sold 3 pints, on Tuesday 2 pints, on Wednesday 4 pints, and on Thursday 1 pint. How many quarts of milk did he sell?

Units and Tens

Introductory.

Count out 10 sticks, 20 sticks, 15 sticks, 26 sticks, 17 sticks. Put these in separate piles.

From the pile of 17 sticks count out 10. Tie these in a bundle. In 17 sticks there is 1 bundle of 10 sticks and 7 sticks over. Similarly with 26 sticks there are 2 bundles of 10 and 6 sticks over.

In 15 sticks there is 1 bundle of 10 and 5 sticks over.

In 20 sticks there are 2 bundles of 10 and 0 over.

In 10 sticks there is 1 bundle of 10 and 0 over.

Write down 17, 26, 15, 20, and 10.

Consider 17.

What does the 7 represent? Answer, 7 ones.

What does the 1 represent? Answer, 1 ten.

We see then that 17 is made up of 2 figures, the right-hand figure standing for *ones* or *units* and the left-hand figure standing for *tens*.

Consider 26.

The 6 stands for 6 units or ones and the 2 for 2 tens.

In writing numbers from 10 to 99 we require 2 figures. The right-hand figure is called the units figure. The figure to the left of the units is called the tens figure.

EXERCISE

Give the units figure and the tens figure in each of the following :

1. 37	59	63	87	22
2. 19	80	79	33	50
3. 53	75	97	46	66

Write from dictation, placing the units figures under units figures and tens figures under tens figures, the following :

4. 38	50	21	17	99
5. 37	26	52	36	90

State the number of units and tens in each of the numbers in Examples 4 and 5.

Write the following numbers with figures and write the number of units and tens in each :

Example: Forty-six, $46 = 4$ tens 6 units.

6. Seventy-five; thirty-nine; sixty.
7. Thirty-one; ninety-five; fifty-five.
8. Sixty-three; twenty-seven; eighty.
9. Nineteen; seventy-seven; thirty-seven.
10. Thirteen; eighty-one; forty-four.

Write the numbers made up of the following units and tens:

11. 5 tens 4 units; 8 tens 8 units.
12. 6 tens 0 units; 3 tens 7 units.
13. 1 ten 9 units; 9 tens 1 unit.
14. 2 tens 8 units; 8 tens 0 units.
15. 7 tens 7 units; 4 tens 0 units.

10. William earned 78 cents in May, 35 cents in June, and 82 cents in July. How much did he earn during the three months?

Subtraction with Borrowing.

Introductory.

- Find the difference between 92 and 75.

$$\begin{array}{r} 92 \\ -75 \\ \hline 17 \end{array}$$

Write the smaller number under the larger. Begin at the units column. 5 cannot be taken from 2. Take 1 ten from 9 tens leaving 8 tens. Add this 1 ten or 10 units to the 2 units, making 12 units. 5 from 12 = 7 and 7 from 8 = 1.

Check. Add 17 to 75. Sum is 92.

- Find the difference between 70 and 28.

$$\begin{array}{r} 70 \\ -28 \\ \hline 42 \end{array}$$

Check by adding 42 and 28. Sum is 70.

A lesson on the tables should always be followed by the application of the tables in addition columns. The order of the numbers in the addition columns should be carefully chosen, so as to include the number relations taught in the tables along with the combinations of the numbers up to 20.

In presenting the tables of endings to the pupils, emphasize the ending forms. For example :

3	3	3	3	3
5	25	45	15	55
<hr/>	<hr/>	<hr/>	<hr/>	<hr/>
8	28	48	18	58 etc.

The teacher should draw attention to the fact that the ending of the units in each case is the same. Give the pupils frequent oral drills on the tables, dictating the numbers in various sequences.

The tables should be applied in both oral and sight addition.

TELLING TIME

TO THE TEACHER. — The teacher should have a cardboard clock dial with movable hands. This should be used in teaching the time and in testing the pupils in telling time.

Review with the pupils the numerals on the clock dial. Test the class in telling the hour, half hour, and quarter hour.

Show the divisions on the clock for minutes. Each hour space represents 5 minute spaces.

CLOCK

By means of the clock dial, show the pupils the following:

5 minutes past the hour, 10 minutes past the hour.

20 minutes past the hour, 25 minutes past the hour.

5 minutes to the hour, 10 minutes to the hour.

20 minutes to the hour, 25 minutes to the hour

EXERCISE

Move the hands of the clock dial to represent the following time and ask the pupils to tell the time:

1. 20 minutes after 3; 10 minutes after 5; 25 minutes after 8; 5 minutes after 4.

2. 10 minutes to 2; 25 minutes to 6; 5 minutes to 7; 25 minutes to 12.

Show the pupils the *one-minute* spaces.

Test the pupils in pointing out different minute spaces such as :

3. 4 minutes after the hour, 16 minutes after the hour, 22 minutes after the hour, etc.

4. 12 minutes to the hour, 26 minutes to the hour, 22 minutes to the hour, etc

By means of the clock dial show the pupils different time and have them read the time.

Test the individual pupils carefully and frequently. This work should be continued until each one is able to read the time without difficulty.

Move the hands of the clock dial to represent the following time. Ask the pupils to tell the time.

5. 17 minutes after 5 ; 26 minutes after 8 ; 19 minutes after 2, etc.

6. 24 minutes to 2 ; 3 minutes to 4 ; 14 minutes to 6, etc.

CANADIAN MONEY

The teacher should have the various coins of Canadian money in the class room. The children should become familiar with the different coins and with the one-dollar bill.

Using the actual coins, the teacher should give the pupils exercises in exchanging coins for those of other denominations, making change, etc.

5 one-cent pieces = 1 five-cent piece.

2 five-cent pieces = 1 ten-cent piece

4 quarters = 1 dollar.

2 quarters = 1 fifty-cent piece.

2 fifty-cent pieces = 1 dollar.

Notation for Canadian Money.

Introductory.

1. John has 2 dollars. Write down how much money he has.

2 dollars = \$2

2. Mary has 3 dollars and 25 cents. Write down how much money she has.

3 dollars and 25 cents = \$3.25.

Study the number 326.

6 represents 6 units.

2 represents 2 tens.

3 represents 3 hundreds.

The third place in writing numbers is the hundreds place.

1 hundred = 10 tens = 100 units.

CHAPTER III

NOTATION, NUMERATION. THE FOUR SIMPLE RULES

READING AND WRITING NUMBERS FROM 1000 TO 10,000

One thousand is written 1000.

Two thousand is written 2000.

Three thousand is written 3000.

Four thousand is written 4000.

Five thousand is written 5000.

Six thousand is written 6000.

Seven thousand is written 7000.

Eight thousand is written 8000.

Nine thousand is written 9000.

Ten thousand is written 10,000.

One thousand eight hundred sixty-seven is written 1867.

1867 = 1 thousand 8 hundreds 6 tens 7 units.

Five thousand two hundred forty-three is written 5243.

5243 = 5 thousands 2 hundreds 4 tens 3 units.

Note. — The *fourth* place in writing numbers is the *thousands* place.

Read the following numbers :

	<i>a</i>	<i>b</i>	<i>c</i>	<i>d</i>	<i>e</i>
1.	5367	8231	6729	3283	7273
2.	7650	5305	9284	7638	4303
3.	2100	7340	9200	8460	6050
4.	6500	2034	5089	9060	8072
5.	7004	8600	9007	6005	8030

Write from dictation :

	<i>a</i>	<i>b</i>	<i>c</i>	<i>d</i>	<i>e</i>
6.	3227	4583	6720	8329	2365
7.	5286	9837	4628	5675	8364
8.	7200	6030	5072	8072	6070
9.	2005	3070	6008	9035	8040
10.	5643	7083	9006	7016	8036

Write down the following numbers, stating the number of thousands, hundreds, tens, and units in each number
Thus :

6328 = 6 thousands, 3 hundreds, 2 tens, 8 units.

	<i>a</i>	<i>b</i>	<i>c</i>	<i>d</i>	<i>e</i>
11.	3275	4860	5983	7659	8340
12.	9650	7835	8420	9225	6427
13.	8700	5600	2830	4020	7006
14.	9006	8002	6070	4075	6040
15.	6500	7200	8263	5960	7239

NOTE TO THE TEACHER. — The pupils should be given frequent practice in reading numbers.

Write in figures :

16. Two thousand three hundred sixty-three.
17. Four thousand five hundred seventy.
18. Eight thousand twenty-seven.
19. Nine thousand three hundred six.
20. Six thousand two hundred ninety-six.

Roman Notation up to 25

Write down the Roman numbers for :

10 5 3 1 12 9 7 4 8

In reading the time the pupils have learned :

1	2	3	4	5	6
I	II	III	IV	V	VI
7	8	9	10	11	12
VII	VIII	IX	X	XI	XII

To write 15 the symbols for 10 and 5 are used. Thus,

$$15 = 10 + 5 = \text{XV} \qquad 20 = 10 + 10 = \text{XX}$$

$$19 = 10 + 9 = \text{XIX} \qquad 21 = 20 + 1 = \text{XXI}$$

$$25 = 10 + 10 + 5 = \text{XXV}$$

Teach :

13	14	15	16	17	18	19
XIII	XIV	XV	XVI	XVII	XVIII	XIX
20	21	22	23	24	25	
XX	XXI	XXII	XXIII	XXIV	XXV	

EXERCISE

Read the following numbers aloud :

<i>a</i>	<i>b</i>	<i>c</i>	<i>d</i>	<i>e</i>
1. XIV	XVII	XXII	XV	XIX
2. IX	XXIV	XIV	XVIII	XXI
3. XIII	XX	XI	XXV	XVI
4. XXIII	XII	X	XIX	XXIV

Write in figures the numbers expressed by the Roman numerals given above.

ADDITION

The pupils have learned to add columns, the sums of which do not exceed 50. Longer columns, with sums increasing until 100 is reached, should now be taken. The

number relations should be based on the fundamental combinations and the tables of endings.

Note. — Accuracy and time tests should be taken frequently. The following are a few suggestive exercises.

The teacher dictates, and the pupils give the answers orally :

	<i>a</i>	<i>b</i>	<i>c</i>	<i>d</i>	<i>e</i>	<i>f</i>	<i>g</i>	<i>h</i>

SUBTRACTION

Alternative Method.

Example 1 : Find the difference between 3256 and 1879.

PROCESS

$$\begin{array}{r} 3256 \\ 1879 \\ \hline 1377 \end{array}$$

Write the smaller number under the larger, placing units under units, tens under tens, etc. Begin at the units column. Since 9 is greater than 6, think 9 and 7 are 16. Write down 7 in the units column. Carry 1 to 7 in the tens column, which makes 8. Since 8 is greater than 5, think 8 and 7 are 15.

Write down 7 in the tens column. Carry 1 to 8 in the hundreds column, making 9. Since 9 is greater than 2, think 9 and 3 are 12. Write down 3. Carry 1 to 1 in the thousands column, making 2. 2 and 1 are 3. Write down 1 in the thousands column.

Check by adding 1377 and 1879; the sum is 3256

CHAPTER IV

THE FOUR SIMPLE RULES AND APPLICATIONS

READING AND WRITING NUMBERS FROM 10,000 TO MILLIONS

Ten thousand is written 10,000.

Twenty thousand is written 20,000.

Thirty thousand is written 30,000.

Forty thousand is written 40,000.

Fifty thousand is written 50,000.

One hundred thousand is written 100,000.

Two hundred thousand is written 200,000.

Five hundred thousand is written 500,000.

Nine hundred thousand is written 900,000.

One million is written 1,000,000.

Fifty-six millions is written 56,000,000.

Read 653,247.

Beginning with the units, mark off to the left, periods of three figures. The first period of three figures is usually called the *units period*. It contains the units, tens, and hundreds figures. The second period is called the *thousands period*. In this period the figures are read in the ordinary way and are called thousands.

Example: Read 698,358.

Mark off the number into periods. The units period contains 358. The thousands period contains 698. Begin to read from the left.

Thus, six hundred ninety-eight *thousand*, three hundred fifty-eight.

Read 720,207.

Seven hundred twenty *thousand*, two hundred seven.

If a number contains more than six figures, there will be a third period after the thousands. This is called the *millions period*.

Read 7,283,567.

Seven million, two hundred eighty-three thousand, five hundred sixty-seven.

The following table illustrates the method of marking off numbers into periods:

Examples: 72,386,258 ; 234,708,530.

MILLIONS			THOUSANDS			UNITS		
Hundreds	Tens	Units	Hundreds	Tens	Units	Hundreds	Tens	Units
	7	2	3	8	6	2	5	8
2	3	4	7	0	8	5	3	0

EXERCISE

<i>a</i>	<i>b</i>	<i>c</i>
1. 328,475	72,683	9,728,560

3. 965,500	78,600,500	590,070,850

MULTIPLYING BY NUMBERS THAT EXCEED TWELVE

Introductory.

Multiply 9783 by 7.

$\begin{array}{r} 9783 \\ 7 \\ \hline 68,481 \end{array}$	<p>In this example the number 9783 is called the <i>multipl-</i> <i>cand</i>, the number 7 the <i>multiplier</i>, and the number 68,481 the <i>product</i>.</p>
---	---

The *Multiplcand* is the number multiplied.

The *Multiplier* is the number by which we multiply.

The *Product* is the number resulting from the multiplication

Example: Multiply 479 by 57.

$$\begin{array}{r}
 479 \\
 \underline{57} \\
 \text{1st partial product} \quad 3,353 = 7 \text{ times the multiplicand.} \\
 \text{2nd partial product} \quad 23,950 = 50 \text{ times the multiplicand} \\
 \text{Entire product} \quad 27,303 = 57 \text{ times the multiplicand.}
 \end{array}$$

Since 57 is composed of 7 units and 5 tens or 50, 57 times the number must be equal to 7 times the number plus 50 times the number. 7 times 479 is 3353, the *first partial* product. We get 50 times 479 by first finding 10 times 479 and then multiplying this result by 5. 10 times 479 is 4790 and 5 times 4790 is 23,950, the *second partial* product. We write this under the first product, so that units come under units, tens under tens etc., and then we add the two partial products together.

$$\begin{array}{r}
 479 \\
 \underline{57} \\
 3353 \\
 23950 \\
 \hline
 27,303
 \end{array}$$

In actual practice we always omit the zero.

Example: Multiply 479 by 257.

$$\begin{array}{r}
 479 \\
 \underline{257} \\
 \text{1st partial product} \quad 3,353 = 7 \text{ times } 479. \\
 \text{2nd partial product} \quad 23,950 = 50 \text{ times } 479. \\
 \text{3rd partial product} \quad 95,800 = 200 \text{ times } 479. \\
 \text{Entire product} \quad 123,103 = 257 \text{ times } 479.
 \end{array}$$

In this example the multiplier is composed of 7 units, 5 tens or 50 and 2 hundreds or 200, so that 257 times the number will be 7 times the number, plus 50 times the number, plus 200 times the number.

$$\begin{array}{r}
 479 \\
 \underline{257} \\
 3353 \\
 2395 \\
 958 \\
 \hline
 123,103
 \end{array}$$

In actual practice we omit the zeros.

Check. — Multiply the multiplier by the multiplicand. If the product is the same as before, the work is likely to be correct.

EXERCISE

Multiply :

- | | |
|-------------------|-------------------|
| 1. 744 by 65 | 17. 43,445 by 678 |
| 2. 895 by 87 | 18. 37,436 by 835 |
| 3. 972 by 96 | 19. 88,888 by 789 |
| 4. 825 by 58 | 20. 23,567 by 597 |
| 5. 973 by 79 | 21. 6484 by 965 |
| 6. 8462 by 86 | 22. 7856 by 758 |
| 7. 9643 by 95 | 23. 6748 by 697 |
| 8. 8532 by 69 | 24. 4878 by 834 |
| 9. 8984 by 48 | 25. 8547 by 586 |
| 10. 4659 by 89 | 26. 85,474 by 745 |
| 11. 28,352 by 64 | 27. 46,887 by 984 |
| 12. 41,678 by 85 | 28. 56,184 by 798 |
| 13. 34,073 by 63 | 29. 56,664 by 487 |
| 14. 40,735 by 628 | 30. 25,473 by 448 |
| 15. 29,304 by 789 | 31. 73,519 by 473 |
| 16. 90,705 by 897 | 32. 81,897 by 654 |

To multiply, when the multiplicand, the multiplier, or both, contain zeros.

Example: Multiply 2479 by 4006.

$$\begin{array}{r} 2479 \\ 4006 \\ \hline 14874 \\ 9916 \\ \hline 9,930,874 \end{array}$$

4006 times 2479 equals 4000 times 2479 plus 6 times 2479; 6 times 2479 is 14,874; 4000 times 2479 is 9,916,000. These partial products are written one under the other, the zeros being omitted.

EXERCISE

Multiply :

- | | |
|-----------------|--------------------|
| 1. 415 by 307 | 7. 9684 by 4008 |
| 2. 7004 by 902 | 8. 2002 by 4103 |
| 3. 2769 by 708 | 9. 3678 by 7068 |
| 4. 7364 by 5004 | 10. 9999 by 8008 |
| 5. 9006 by 7036 | 11. 3674 by 20,901 |
| 6. 8009 by 7008 | 12. 3798 by 40,809 |

Example: Multiply 614,000 by 700.

$$\begin{array}{r} 614,000 \\ 700 \\ \hline 429,800,000 \end{array}$$

This result is the same as that obtained by multiplying 614 by 7 and then annexing to the right *five* zeros, which is the sum of the number of zeros to the right of both the multiplicand, 614, and the multiplier, 7.

| 3. 9642×6300 | 9. 650×650 |

DIVISION BY NUMBERS THAT EXCEED 12

Introductory.

Divide 86,573 by 9.

$$\begin{array}{r} 9,619 \quad 2 \text{ remainder} \\ 9 \overline{)86,573} \end{array}$$

In the example above, 86,573 is called the *dividend*, 9 is called the *divisor*, 9619 is called the *quotient*, and 2 is called the *remainder*.

The *dividend* is the number to be divided.

The *divisor* is the number by which the dividend is divided.

The *quotient* is the number of times the divisor is contained in the dividend.

The *remainder* is the number left over when the division is not exact.

LONG DIVISION

In the example given above, the work of division is done mentally. Where we have large numbers, it is necessary to write down all the steps, showing the work in dividing, multiplying, and subtracting.

Example: Divide 86,573 by 9.

$$\begin{array}{r}

EXPLANATION

76 hundreds divided by 43 is 1 hundred. Write 1 in the quotient above the hundreds. Then 43×1 hundred = 43 hundreds. Subtract 43 hundreds from 76 hundreds. Remainder is 33 hundreds. To 33 hundreds add 8 tens, making 338 tens. 338 tens divided by 43 are 7 tens. Write 7 tens in the quotient above the tens. Then 43×7 tens = 301 tens. Subtract 301 tens from 338 tens. Remainder is 37 tens. To 37 tens add 1 unit, making 371 units. 371 units divided by 43 are 8 units. Write 8 units in the quotient, above the units. Then 43×8 units are 344 units. Subtract 344 units from 371 units. Remainder is 27 units.

NOTE TO THE TEACHER. — The teacher should develop the brief form of long division shown on the left. The pupils should not be required to learn or to write down the detailed explanation of the method.

Example: Divide 100,221 by 37.

FRACTIONS

Into how many equal parts is the square A divided?

Into how many equal parts is the square B divided?

Into how many equal parts is the square C divided?

What part of square A is each of the two equal parts?

What part of square B is each of the four equal parts?

What part of the square C is each of the eight equal parts?

One or more of the equal parts into which a unit is divided is called a *fraction*.

A square, a line, a circle, 1 dollar, 1 inch, 1 are called units.

When the square A is divided into two equal parts, each part is also a unit, but a smaller unit than the whole square of which each is a part. Each of these equal units is a fractional part of the large unit, the whole square; each unit is one-half of it. These units are called *fractional units*.

A fractional unit is one of the equal parts into which a unit is divided.

What is the fractional unit of each part in square B? In square C?

The fractional unit in square A is one-half, written $\frac{1}{2}$.

The fractional unit in square B is one-fourth, written $\frac{1}{4}$.

The fractional unit in square C is one-eighth, written $\frac{1}{8}$.

Three of the fractional units in square B are represented by the fraction $\frac{3}{4}$. Five of the fractional units in square C are represented by the fraction $\frac{5}{8}$.

A fraction consists of one or more fractional units, as $\frac{1}{2}$, $\frac{3}{4}$, $\frac{5}{8}$, $\frac{2}{3}$, $\frac{4}{5}$, etc.

The number below the line shows the number of equal parts or fractional units into which the whole is divided.

The number above the line shows how many of the equal parts or fractional units are taken.

Write the fractions representing one of the equal parts of the line AB ; two of the equal parts of the line MN ; three of the equal parts of the line MN ; four of the equal parts of the line ST ; seven of the equal parts of the line ST .

Divide a line into 5 equal parts. What is the fractional unit of each part? Write the fraction that represents 2 of these parts; 3 of these parts; 4 of these parts; 5 of these parts.

 6

Add: $4\frac{2}{4}$ $\frac{2}{4} + \frac{3}{4} = \frac{5}{4} = 1 + \frac{1}{4}$. Put down $\frac{1}{4}$ and carry the whole number 1 to the column of whole numbers. The sum of whole numbers is $1+5+4=10$.

$$\begin{array}{r} 5\frac{3}{4} \\ 4\frac{2}{4} \\ \hline 10\frac{1}{4} \end{array}$$

Subtract: $5\frac{3}{4}$

$$\begin{array}{r} 4\frac{2}{4} \\ 5\frac{3}{4} \\ \hline 1\frac{1}{4} \end{array}$$

Divide 12 blocks into six groups, each group having an equal number of blocks. Each group is what part of all the groups? The number in each group will be what part of the whole number of blocks? How many blocks are there in each group?

$$\frac{1}{6} \text{ of } 12 \text{ blocks} = 2 \text{ blocks}$$

$$\frac{1}{6} \text{ of } 12 = 2.$$

How many blocks are there in 2 groups? Two groups are $\frac{2}{6}$ of all the blocks.

$$\frac{2}{6} \text{ of } 12 \text{ blocks} = 4 \text{ blocks}$$

$$\frac{2}{6} \text{ of } 12 = 4.$$

$$\frac{3}{6} \text{ of } 12 = ?$$

$$\frac{4}{6} \text{ of } 12 = ?$$

$$\frac{5}{6} \text{ of } 12 = ?$$

Examples:

To find $\frac{5}{6}$ of 24. $\frac{1}{6}$ of 24 = 4, then $\frac{5}{6}$ of 24 = 5 times 4 = 20.

CHAPTER VI

FACTORS, MEASURES, TESTS OF DIVISIBILITY, CANCELLATION, MULTIPLES

I. Factors

Definition:

When two or more numbers are multiplied together, they make a *product*. The numbers which make up the product are called *factors*.

$$4 \times 3 = 12.$$

4 and 3 are factors of 12.

$$2 \times 3 \times 5 = 30.$$

2 and 3 and 5 are factors of 30.

The multiplicand and multiplier are factors of the product.

Factoring is the process of breaking up a number or a product into its factors.

Thus

$$27 = 3 \times 9.$$

$$105 = 3 \times 5 \times 7.$$

A *Prime Factor* or a *Prime Number* is a number that is not exactly divisible by any whole number except 1 and itself.

Thus 1, 2, 3, 5, 7, 11, 13, etc. are prime numbers.

ORAL EXERCISE

1. Give 2 factors of : 15, 35, 36, 77, 63, and 21.
2. Give 3 factors of : 12, 30, 66, 20, 42, and 56.

3. If 3 is one factor, what is the other factor of 21, 45, 36, 24, 18, and 33?

4. If 12 is one factor, what is the other factor of 60, 48, 72, 96, 24, and 108?

EXERCISE

Find the second factor in each of the following :

	<i>Factor</i>	<i>Product</i>	<i>Other Factor</i>
1.	9	63	
2.	7	105	
3.	11	132	
4.	17	153	
5.	23	161	
6.	29	145	
7.	13	520	
8.	31	341	
9.	37	333	
10.	43	559	

ORAL EXERCISE

Give the prime factors of the following: 15, 18, 35, 28, 42, 56.

To find the prime factors of a large number, for example, 156.

$$\begin{array}{r}
 2 \overline{) 156} \\
 2 \overline{) 78} \\
 3 \overline{) 39} \\
 13 \overline{) 13} \\
 \hline
 1
 \end{array}$$

Divide first by 2, a prime number; then again by 2; then by 3, another prime number. Continue the division by prime numbers.

The prime factors are $2 \times 2 \times 3 \times 13$.

Rule:—To find the prime factors of any number, divide the number by prime factors and continue this division until the final quotient is a prime number.

EXERCISE

Find the prime factors of the following numbers :

	<i>a</i>	<i>b</i>	<i>c</i>	<i>d</i>
1.	28	32	33	48
2.	65	66	72	96
3.	35	36	39	147
4.	49	52	54	108
5.	77	78	81	144
6.	84	88	91	186
7.	165	336	392	297
8.	189	195	396	715
9.	170	105	396	1463
10.	168	576	315	1365

Definition :

If a number is a factor of *two or more* numbers, it is called a *Common Factor* of these numbers.

2 is a common factor of 4 and 14.

7 is a common factor of 21 and 35.

EXERCISE

Find the common factors of each of the following pairs of numbers :

1. 16 and 24

4. 39 and 52

2. 36 and 42

5. 84 and 210

3. 21 and 56

6. 78 and 195

The largest factor that is a common factor of two or more numbers is called the *Highest Common Factor* or *H. C. F.* of the numbers.

Thus 9 is the H. C. F. of 27 and 36.

To find the Highest Common Factor of two or more numbers.

Find the prime factors of the given numbers. The product of the prime factors that are common to all the numbers is the Highest Common Factor of the numbers.

Find the Highest Common Factor of 48, 72, and 96.

$$48 = 2 \times 2 \times 2 \times 2 \times 3$$

$$72 = 2 \times 2 \times 2 \times 3 \times 3$$

$$96 = 2 \times 2 \times 2 \times 2 \times 2 \times 3$$

The factors common to 48, 72, and 96 are $2 \times 2 \times 2 \times 3$.

The product of these factors, 24, is the Highest Common Factor.

EXERCISE

Find the Highest Common Factor of the following :

- | | | | | | | |
|-------|----|----|-------|-----|-----|-------------------|
| 1. 16 | 20 | 24 | 5. 81 | 108 | 162 | 9. 309 and 315 |
| 2. 26 | 78 | 52 | 6. 42 | 63 | 147 | 10. 1908 and 2736 |
| 3. 19 | 76 | 95 | 7. 56 | 96 | 128 | |
| 4. 36 | 54 | 72 | 8. 45 | 75 | 90 | |

II. Measures

1. Find the common factors of 248 and 356. Ascertain whether each common factor of 248 and 356 is also a factor of 108, their difference.

2. Write two numbers having a common factor. Find their sum and their difference, and discover whether the common factor of the two numbers is a factor of their sum and also of their difference.

3. Write two numbers having a common factor. Take any multiple of one of them, and find whether the common factor of the two numbers is a factor of the difference between this multiple and the other number.

It will thus be seen that a common factor of two numbers is also a factor of the sum or the difference of these numbers, and is also a factor of the difference between a multiple of one of them and the other.

To find the Highest Common Factor when the numbers are large:

Example: Find the H. C. F. of 52 and 91.

$ \begin{array}{r} 52)91(1 \\ \underline{52} \\ 39)52(1 \\ \underline{39} \\ 13)39(3 \\ \underline{39} \\ 0 \end{array} $	<p>13 is a divisor of 39 and, therefore, of 13 plus 39, or 52. Since it divides 39 and 52, it also divides 39 plus 52, or 91; 13 is, therefore, a divisor or factor of 52 and 91. It is also the Greatest Common Factor. If not, let a greater number divide 52 and 91; it will then divide 39, their difference, and, dividing 39 and 52, it will also divide their difference, or 13. That is, a greater number than 13 will divide 13, which is impossible. 13 is therefore the Greatest Common Divisor, or H. C. F., of 52 and 91.</p>
---	--

Hence to find the H. C. F. of two numbers:

(1) Divide the greater number by the less.

(2) Divide the less by the remainder.

(3) Divide the first remainder by the second and continue this process, always dividing the last divisor by the last remainder. The last remainder which divides the preceding divisor exactly is the *Greatest Common Divisor*, or *Highest Common Factor*.

EXERCISE

Find the H. C. F. of:

- | | |
|------------------|---------------------|
| 1. 115 and 161 | 7. 6006 and 3318 |
| 2. 333 and 592 | 8. 2871 and 4213 |
| 3. 697 and 820 | 9. 43902 and 49593 |
| 4. 392 and 672 | 10. 23940 and 28350 |
| 5. 405 and 900 | 11. 32480 and 44544 |
| 6. 1220 and 2013 | 12. 18577 and 40012 |

To find the H. C. F. of more than two numbers.

First find the H. C. F. of two of them. Then find the H. C. F. of the common factor thus found and a third number, and so on through all the numbers. The last common factor found will be the H. C. F. of all the numbers.

EXERCISE

Find the H. C. F. of :

- | | |
|--------------------------|-----------------------|
| 1. 1435 ; 1064 ; 2135 | 3. 4795 ; 3395 ; 6048 |
| 2. 14385 ; 20391 ; 49287 | 4. 5463 ; 6677 ; 7891 |

III. Tests of Divisibility

There are some easy tests of divisibility of certain numbers that should be known. These are as follows :

1. A number is exactly divisible by 2, if it ends in 0 or in an even number.
2. A number is exactly divisible by 4, if the number represented by the two right-hand digits is exactly divisible by 4, or if the last two digits are zeros.
3. A number is exactly divisible by 5, if it ends in 5 or 0.
4. A number is exactly divisible by 3, if the sum of its digits is exactly divisible by 3.
5. A number is exactly divisible by 9, if the sum of its digits is exactly divisible by 9.
6. A number is exactly divisible by 8, if the number represented by the three right-hand digits is exactly divisible by 8, or if the last three digits are zeros.
7. A number is exactly divisible by 6, if it is an even number and if the sum of its digits is exactly divisible by 3.

IV. Cancellation

Simplify 12×18 divided by 4×6 .

$(12 \times 18) \div (4 \times 6)$ is the same as

$$\begin{array}{r} 1 \\ 2 \quad 9 \\ \hline 12 \times 18 = 9 \\ 4 \times 6 \\ 2 \quad 1 \\ 1 \end{array}$$

Explanation.

Select common factors from dividend and divisor.

6 is a common factor of 12 and 6

2 is a common factor of 18 and 4

2 is a common factor of 2 and 2

The quotient is the product of the remaining factors of the dividend divided by the product of the remaining factors of the divisor, after the cancellation of all common factors.

EXERCISE

1. Simplify each of the following :

$$\frac{9 \times 7}{3 \times 7} = \quad , \quad \frac{7 \times 5 \times 120}{7 \times 4 \times 30} = \quad , \quad \frac{15 \times 20 \times 25}{30 \times 50} = \quad .$$

2. Simplify $(25 \times 36 \times 11) \div (55 \times 4)$.

3. Simplify $(24 \times 27 \times 32) \div (36 \times 48)$.

11. At what price per dozen must 260 dozen eggs be sold to pay for 78 yards of silk at 95 cents per yard?

12. Divide the product of 8, 15, 24, 42, 65, and 77 by the product of all the prime numbers less than 15.

13. If a farmer raises 1050 bushels of wheat on a 30-acre field, how many bushels should he raise at the same rate from 96 acres?

V. Multiples

Definition:

Instead of saying that one number may be divided by another number exactly, we sometimes say that the first number is a *Multiple* of the second number.

For example: 18 is a multiple of 3, 6, and 9.

ORAL EXERCISE

1. Give 3 multiples of each of the following numbers: 5, 7, 8, 9, and $2\frac{1}{2}$.

2. What are the following numbers multiples of: 35, 48, 27, 63, 56?

3. Give all the multiples of 2 of the numbers from 4 to 40 inclusive.

4. Give all the multiples of 3 of the numbers from 6 to 57 inclusive.

5. 38 is a multiple of what *two* factors?

Definition:

When a number is exactly divisible by two or more numbers it is said to be a *Common Multiple* of these numbers.

For example: 42 is a common multiple of 6 and 7.

105 is a common multiple of 3, 5, and 7.

Definition:

The smallest number that is exactly divisible by two or more numbers is called the *Least Common Multiple* (L. C. M.) of those numbers.

For example: 105 is the L. C. M. of 21 and 35.

ORAL EXERCISE

1. Give *four* numbers that contain both 2 and 7 as factors.
2. Give *four* numbers that contain both 3 and 5 as factors.
3. Give the *Least Common Multiple* of each of the following pairs of numbers:

4 and 7

6 and 9

5 and 11

7 and 8

9 and 12

3 and 7

To Find the Least Common Multiple of Two or More Numbers

Example: To find the L. C. M. of 56, 60, 84, and 112.

Factor each of the numbers.

$$56 = 2 \times 2 \times 2 \times 7$$

$$60 = 2 \times 2 \times 3 \times 5$$

$$84 = 2 \times 2 \times 7 \times 3$$

$$112 = 2 \times 2 \times 2 \times 2 \times 7$$

The Least Common Multiple of these numbers must be a number which will contain all the prime factors of each of the numbers.

2 will be a factor of the L. C. M. repeated *four* times, since 112 contains 2 as a factor repeated *four* times.

3 will be a factor of the L. C. M. *once*, since 60 and 84 contain 3 as a factor *once*.

5 will be a factor of the L. C. M. *once*, since 60 contains 5 as a factor *once*.

7 will be a factor of the L. C. M. *once*, since 56, 84, and 112 each contains 7 as a factor *once*.

The L. C. M. is $2 \times 2 \times 2 \times 2 \times 3 \times 5 \times 7$, or 1680.

The work of factoring may be put down in shortened form.

2	56,	60,	84,	112
2	28,	30,	42,	56
2	14,	15,	21,	28
3	7,	15,	21,	14
7	7,	5,	7,	14
	1,	5,	1,	2

Divide by prime factors beginning with the lowest. Continue the division so long as there are common factors.

L. C. M. is $2 \times 2 \times 2 \times 2 \times 3 \times 5 \times 7$.

ORAL EXERCISE

When anything is divided into 2 equal parts, what is each part called?

What is each part called when anything is divided into 4 equal parts? into 8 equal parts? into 3 equal parts? into 6 equal parts? into 5 equal parts?

We write these parts as $\frac{1}{2}$, $\frac{1}{4}$, $\frac{1}{8}$, $\frac{1}{3}$, $\frac{1}{6}$, $\frac{1}{5}$.

In Figure B we see that if we divide $\frac{1}{2}$ into 2 equal parts we get $\frac{1}{4}$.

That is,

$$\frac{1}{2} \text{ of } \frac{1}{2} = \frac{1}{4}$$

$$\frac{1}{4} + \frac{1}{4} = ?$$

In Figure C we divided $\frac{1}{2}$ into 4 equal parts, and each part is $\frac{1}{8}$.

That is,

$$\frac{1}{4} \text{ of } \frac{1}{2} = \frac{1}{8}$$

$$\frac{1}{8} + \frac{1}{8} + \frac{1}{8} + \frac{1}{8} = ?$$

In Figure C each $\frac{1}{4}$ is divided into 2 equal parts, and each part is $\frac{1}{8}$.

That is,

$$\frac{1}{2} \text{ of } \frac{1}{4} = \frac{1}{8}$$

$$\frac{1}{8} + \frac{1}{8} = \frac{1}{4}$$

Consider the Figures A, B, C, and D.

A is what part of B? of C? of D?

B is what part of C? of D?

C is what part of D?

If we call D 1, then we shall call A 1 quarter, B 2 quarters, and C 3 quarters.

If we call A 1, then we shall call B 2, C 3, and D 4.

If B is called 1, what shall we call A? C? D?

If C is called 1, what shall we call A? B? D?

If we divide a circle into two equal parts, what do we call each part?

If we divide a circle into 4 equal parts, each part is called $\frac{1}{4}$.

How many quarters are there in the whole circle?

If we take three of these equal parts, we have 3 quarters of the circle.

This is written $\frac{3}{4}$.

If we take 2 of these equal parts, we have 2 quarters.

This is written $\frac{2}{4}$.

If we divide a circle into 3 equal parts and take 2 of them, how much of the circle have we?

This is written $\frac{2}{3}$.

If we divide a circle into 8 equal parts and take 3 of them, 4 of them, 5 of them, 7 of them, 6 of them, 2 of them, what part of the circle have we in each case?

These are written : $\frac{3}{8}$ $\frac{4}{8}$ $\frac{5}{8}$ $\frac{7}{8}$ $\frac{6}{8}$ $\frac{2}{8}$.

To find a fraction of a number of units.

We have six cubes. Let us divide these into two equal groups. There are three in each group. The group 6 has been divided into 2 equal groups. Each of the smaller groups is *one-half* the larger group. Then $\frac{1}{2}$ of 6 is 3.

Similarly if we had 10 objects and divided these into 5 groups with the same number in each group, each of the smaller groups would contain 2 objects. Each of the smaller groups is one-fifth the larger group.

$\frac{1}{5}$ of 10 is 2. $\frac{2}{5}$ of 10 is 4. $\frac{3}{5}$ of 10 is 6.

EXERCISE

1. What is $\frac{1}{2}$ of 12? $\frac{1}{5}$ of 15? $\frac{1}{3}$ of 18? $\frac{1}{4}$ of 20?
 $\frac{1}{6}$ of 18? $\frac{1}{11}$ of 33? $\frac{1}{9}$ of 27?

2. What is $\frac{2}{3}$ of 12? $\frac{3}{5}$ of 15? $\frac{3}{4}$ of 16? $\frac{4}{5}$ of 25?
 $\frac{5}{6}$ of 36? $\frac{4}{5}$ of 54? $\frac{5}{12}$ of 60?

3. One unit = $\frac{2}{2} = \frac{2}{3} = \frac{2}{4} = \frac{2}{5} = \frac{2}{7} = \frac{2}{9} = \frac{2}{12} = \frac{2}{15} = \frac{2}{25} = \frac{2}{75}$.

4. Show by drawings or by cutting a square of paper the following: $\frac{1}{2} = \frac{2}{4} = \frac{3}{6} = \frac{4}{8} = \frac{5}{10} = \frac{6}{12} = \frac{8}{16}$.

5. $\frac{1}{5} = \frac{2}{10} = \frac{2}{15} = \frac{2}{20} = \frac{2}{25}$.

6. $\frac{4}{5} = \frac{8}{10} = \frac{8}{15} = \frac{8}{20} = \frac{8}{25} = \frac{8}{30}$.

A *unit* is one thing considered as an undivided whole.

A *fraction* is one or more of the equal parts into which a unit has been divided, as: $\frac{1}{2}$, $\frac{3}{4}$, $\frac{5}{6}$, $\frac{7}{8}$, $\frac{1}{9}$, etc.

The *denominator* of a fraction shows the number of equal parts into which the unit has been divided. It is written below the line in writing fractions. 8, 6, 5, 4 are the denominators of $\frac{3}{8}$, $\frac{2}{6}$, $\frac{1}{5}$, $\frac{3}{4}$.

The *numerator* of a fraction shows how many of the equal parts have been taken to make the fraction. The numerator is written above the line. In the fractions, $\frac{5}{8}$, $\frac{4}{7}$, $\frac{1}{5}$, $\frac{7}{9}$, 5, 4, 1, and 7 are the numerators.

The *numerator* and *denominator* are called the *terms* of the fractions.

A *proper fraction* is one whose numerator is smaller than its denominator, as: $\frac{2}{3}$, $\frac{1}{4}$, $\frac{5}{16}$.

A *unit fraction* is a fraction having 1 as numerator.

An *improper fraction* is one whose numerator is equal to or greater than its denominator, as: $\frac{5}{5}$, $\frac{7}{4}$, $\frac{12}{9}$.

A *mixed number* is the sum of a whole number and a fraction expressed as one number, as: $7\frac{2}{3}$, $3\frac{3}{5}$, $24\frac{1}{4}$.

Diagram A

The line AB is divided into 16 equal parts, and at C the line is divided into two equal parts. At D and E , AC and CB are each divided into 2 equal parts, and the line AB at D , C , and E is divided into 4 equal parts.

What part of the line AB is the line AC ?

What part of the line AB is the line AD ?

What part of the line AC is the line AD ?

Mark on the line the following fractions:

$$\frac{3}{4}, \frac{4}{8}, \frac{5}{16}, \frac{1}{2}, \frac{7}{8}, \frac{1}{4}, \text{ etc.}$$

Consider the fractions, $\frac{1}{2}$, $\frac{1}{4}$, and $\frac{1}{8}$. If we multiply the denominators of each of these by 2, we get

$$\frac{1}{2 \times 2} = \frac{1}{4}, \quad \frac{1}{4 \times 2} = \frac{1}{8}, \quad \frac{1}{8 \times 2} = \frac{1}{16}.$$

Compare $\frac{1}{2}$ and $\frac{1}{4}$; $\frac{1}{4}$ and $\frac{1}{8}$; $\frac{1}{8}$ and $\frac{1}{16}$.

By reference to Diagram A, what is the relation of these fractions to each other?

If we multiply the denominator of a fraction by any number, what is the change in the value of the fraction?

Consider the fractions $\frac{1}{2}$, $\frac{1}{4}$, $\frac{1}{8}$.

Divide the denominators of each of these by 2.

We obtain $\frac{1}{2 \div 2} = \frac{1}{1} = 1, \quad \frac{1}{4 \div 2} = \frac{1}{2}, \quad \frac{1}{8 \div 2} = \frac{1}{4}.$

Dividing the denominator of a fraction by any number produces what change in the value of the fraction?

If we multiply the numerator of a fraction by a number, what change do we make in the value of the fraction?

Illustrate by taking the fractions $\frac{1}{2}$, $\frac{1}{4}$, and $\frac{1}{8}$ and multiplying by 2.

If the numerator of a fraction is divided by a number, what change is there in the value of the fraction?

Consider again the line AB , Diagram A. It is divided into four equal parts at D , C , and E , and also into 16 equal parts.

$\frac{1}{4}$ is equal to how many sixteenths?

$\frac{3}{4}$ is equal to how many sixteenths?

$$\begin{array}{ll} \frac{1}{4} = \frac{4}{16} & \frac{4}{16} = \frac{1}{4} \\ \frac{3}{4} = \frac{12}{16} & \frac{12}{16} = \frac{3}{4} \end{array}$$

Both terms of the fraction may be multiplied or divided by the same number without changing the value of the fraction.

A fraction such as $\frac{1}{16}$ is said to be reduced to *lower terms* when it is changed to the fraction $\frac{3}{4}$, where it has a smaller denominator.

A fraction is changed to its *lowest terms* when the terms of the fraction have not a common factor.

$$\frac{8}{16} = \frac{1}{2} \qquad \frac{14}{21} = \frac{2}{3}$$

To change a fraction to its lowest terms, divide each term by the H. C. F. of these terms.

Example: Reduce $\frac{36}{60}$ to its lowest terms.

Factors of 36 = $2 \times 2 \times 3 \times 3$

Factors of 60 = $2 \times 2 \times 3 \times 5$

Common factors $2 \times 2 \times 3$

$$\text{H. C. F.} = 12$$

Dividing both terms by 12.

$$\frac{36}{60} = \frac{3}{5}$$

The work may be shortened by cancellation of common factors in both terms of the fraction.

EXERCISE

$$\begin{aligned} 3\frac{5}{8} &= 3 + \frac{5}{8} \\ 3 &= \frac{3 \times 8}{8} = \frac{24}{8} \\ 3\frac{5}{8} &= \frac{24}{8} + \frac{5}{8} = \frac{29}{8} \end{aligned}$$

Rule. — To obtain the numerator of the improper fraction, multiply the whole number by the denominator of the fractional part and add the numerator of the fractional part to this product. The denominator of the fractional part will be the denominator of the improper fraction.

ORAL EXERCISE

- | | |
|----------------------------------|----------------------------------|
| $\frac{3}{4}$ is how many 8ths? | $\frac{7}{8}$ is how many 24ths? |
| $\frac{5}{9}$ is how many 27ths? | $\frac{5}{6}$ is how many 36ths? |
| $\frac{2}{5}$ is how many 15ths? | $\frac{4}{9}$ is how many 36ths? |
| $\frac{2}{3}$ is how many 12ths? | $\frac{7}{7}$ is how many 28ths? |

Example: To change $\frac{1}{3}$ to 6ths.

$$1 = \frac{6}{6}, \frac{1}{3} \text{ of } 1 \text{ is } \frac{1}{3} \text{ of } \frac{6}{6} \text{ or } \frac{2}{6}$$

$$\frac{1}{3} = \frac{2}{6}$$

The line AB is divided at C and D into 3 equal parts. Each part, AC , CD , and DB is $\frac{1}{3}$ of the line. The line AB is divided into 6 equal parts at E , C , F , D , and G . Each part AE , EC , CF , FD , DG , and GB is $\frac{1}{6}$ of the line. By comparing the lengths of AC and AE and EC we see that AC is equal to AE and EC together, that is $\frac{1}{3}$ is equal to $\frac{2}{6}$. From a study of the figure, we also see that

$$\begin{aligned}\frac{1}{3} &= \frac{4}{12} & \frac{2}{3} &= \frac{4}{6} = \frac{8}{12} \\ \frac{5}{6} &= \frac{10}{12} & \frac{3}{6} &= \frac{6}{12}\end{aligned}$$

Example: To change $\frac{2}{3}$ to 18ths.

You may multiply both terms of a fraction by the same number without changing its value.

To change the denominator 3rds to 18ths, we multiply by 6.

Hence, in order that the fraction may not have its value changed we must multiply the numerator by the same number 6.

$$\frac{2}{3} = \frac{2 \times 6}{3 \times 6} = \frac{12}{18}$$

Rule. — To change a fraction to a fraction having the same value but of larger denominator, write down the new denominator, divide the new denominator by the old denominator, and multiply the numerator by the quotient, for the new numerator.

ORAL EXERCISE

1. Change to 8ths: $\frac{1}{2}$, $\frac{3}{4}$, $\frac{1}{4}$.

4. Change to 18ths: $\frac{7}{9}$, $\frac{5}{6}$, $\frac{2}{3}$, $\frac{1}{2}$, $\frac{5}{9}$.

5. Change $\frac{5}{7}$ to fractions having 14, 21, 28, and 35 as denominators.

6. Change $\frac{5}{8}$ to fractions having 12, 18, 24, 30, and 36 as denominators.

7. Change $\frac{2}{3}$ to fractions having 6, 12, 15, 18, 27, and 36 as denominators.

EXERCISE

1. Change $\frac{2}{3}$, $\frac{3}{4}$, and $\frac{1}{2}$ to 12ths.

3. Change $\frac{4}{7}$, $\frac{3}{5}$, and $\frac{7}{10}$ to 70ths.

4. Change $\frac{5}{8}$, $\frac{2}{7}$, and $\frac{3}{4}$ to 56ths.

5. Change $\frac{4}{5}$, $\frac{2}{3}$, $\frac{5}{6}$, and $\frac{3}{4}$ to 60ths.

6. Change $\frac{4}{5}$, $\frac{2}{3}$, and $\frac{5}{7}$ to 105ths.

Fractions having the same denominator are said to be *Similar Fractions*.

Examples: $\frac{1}{4}$, $\frac{3}{4}$, $\frac{2}{4}$, $\frac{5}{7}$, $\frac{2}{7}$, $\frac{6}{7}$, $\frac{3}{7}$.

Fractions not having the same denominator may be reduced to similar fractions. The smallest common denominator which may serve for several fractions is called their *Least Common Denominator*.

Example: $\frac{2}{3}$, $\frac{3}{4}$, $\frac{5}{6}$ are not similar fractions. They may be changed to similar fractions with 36 as denominator.

$$\frac{24}{36}, \frac{27}{36}, \text{ and } \frac{30}{36}.$$

They may be changed to similar fractions with 72 as denominator.

$$\frac{48}{72}, \frac{54}{72}, \frac{60}{72}.$$

But 24 is the least common denominator.

From observation it will be seen that the least common denominator of fractions is the L. C. M. of their denominators.

To find the least common denominator of a set of fractions find the L. C. M. of the denominators.

Example:

Reduce $\frac{7}{16}$, $\frac{3}{16}$, and $\frac{5}{24}$ to similar fractions having the least common denominator.

Find the L. C. M. of the denominators.

$$10 = 2 \times 5$$

$$16 = 2 \times 2 \times 2 \times 2 \quad \text{L. C. M.} = 2 \times 2 \times 2 \times 2 \times 3 \times 5$$

$$24 = 2 \times 2 \times 2 \times 3 \quad = 240$$

$$\frac{7}{16} = \frac{168}{240} \quad \frac{3}{16} = \frac{45}{240} \quad \frac{5}{24} = \frac{50}{240}$$

5. Subtraction. $29\frac{1}{5} - 13\frac{7}{12}$.

The least common denominator is 60.

$$\begin{aligned} 29\frac{1}{5} &= 29\frac{12}{60} = 28\frac{72}{60} \\ 13\frac{7}{12} &= 13\frac{35}{60} = \underline{13\frac{35}{60}} \\ \text{Subtracting:} & \quad 15\frac{37}{60} \end{aligned}$$

We cannot take $\frac{35}{60}$ from $\frac{12}{60}$. Take 1 from the 29 leaving 28, and add 1 or $\frac{60}{60}$ to $\frac{12}{60}$ making $\frac{72}{60}$.

To add or subtract fractions, reduce the fractions to similar fractions having the least common denominator.

When mixed numbers are to be added or subtracted, the fractional part may be added or subtracted separately from the whole numbers.

Cancellation in Fractions

We may divide the numerator and denominator of a fraction by the same factor. This process is called *cancellation*.

Example:

Reduce $\frac{56}{42}$ to a mixed number.

$$\frac{56}{42} = \frac{7 \times 4 \times 2}{7 \times 3 \times 2}$$

We may cancel the common factors 7 and 2 in the numerator and the denominator by dividing by these numbers.

$$= \frac{4}{3} = 1\frac{1}{3}$$

Or,

$$\frac{56}{42} = \frac{4}{3} = 1\frac{1}{3}$$

Divide first by 7. Then divide by 2.

4. $\frac{14 \times 8 \times 30 \times 63}{28 \times 72 \times 25 \times 9}$

5. $\frac{27 \times 36 \times 45 \times 17}{18 \times 9 \times 51 \times 25}$

6. $\frac{125 \times 72 \times 24 \times 44}{75 \times 9 \times 33 \times 8}$

7. $\frac{3}{4} \times \frac{12}{15} \times \frac{9}{16} \times \frac{20}{24}$

8. $\frac{9}{12} \times \frac{27}{45} \times \frac{18}{24} \times \frac{56}{72}$

9. $\frac{210}{78} \times \frac{3}{4} \times \frac{195}{63} \times \frac{18}{24} \times \frac{72}{125}$

$$\frac{1}{2} \text{ of } \frac{1}{8} = \frac{1}{8}$$

$$\frac{1}{2} \text{ of } \frac{1}{4} = \frac{1}{8}$$

$$\frac{1}{3} \text{ of } \frac{1}{4} = \frac{1}{12}$$

9. What is one half of 6 ninths? of 10 elevenths? of 16 twentieths?

10. Find $\frac{1}{3}$ of the following: $\frac{12}{17}$, $\frac{15}{22}$, $\frac{18}{25}$.

11. Find $\frac{2}{5}$ of the following: 20, $\frac{20}{27}$, $\frac{25}{31}$.

12. A boy had $\frac{1}{5}$ of a dollar and he lost $\frac{1}{4}$ of what he had. What part of a dollar did he lose?

The line AB is divided into 8 equal parts. Each part is $\frac{1}{8}$ of the whole line.

At C the line AB is divided into 2 equal parts. Each part is $\frac{1}{2}$ of the whole line.

At D and E , AC and CB are divided each into 2 equal parts. Each part is $\frac{1}{4}$ of the whole line.

$AC = \frac{4}{8}$ of the whole line

$AC = \frac{2}{4}$ of the whole line

$AC = \frac{1}{2}$ of the whole line

4 times $\frac{1}{8}$ of the line $= \frac{4}{8}$ of the line $= \frac{2}{4}$ of the line $= \frac{1}{2}$ of the line.

If we multiply the numerator of a fraction by any number, we increase the value of the fraction, *e.g.* 4 times $\frac{1}{8} = \frac{4}{8} = \frac{1}{2}$.

If we divide the denominator of a fraction by any number, we increase the value of the fraction, *e.g.* dividing the denominator of the fraction $\frac{1}{8}$ by 4 we get $\frac{1}{8 \div 4} = \frac{1}{2}$, which is the same as multiplying the numerator of the fraction by 4.

Multiplying the numerator of a fraction by any number increases the number of equal parts, and hence multiplies the fraction.

Dividing the denominator by any number increases the size of the equal parts, and hence multiplies the fraction.

ORAL EXERCISE

- | | | | |
|----------------------------|------------------------------|-------------------------------|------------------------------|
| 1. $4 \times \frac{3}{4}$ | 2. $5 \times \frac{7}{10}$ | 3. $6 \times \frac{5}{8}$ | 4. $7 \times \frac{4}{7}$ |
| 5. $6 \times \frac{8}{12}$ | 6. $7 \times \frac{6}{4}$ | 7. $5 \times \frac{7}{10}$ | 8. $9 \times \frac{7}{18}$ |
| 9. $5 \times \frac{7}{8}$ | 10. $17 \times \frac{7}{51}$ | 11. $13 \times \frac{28}{39}$ | 12. $11 \times \frac{6}{77}$ |

Example:

$$\frac{7}{8} = 7 \text{ times } \frac{1}{8}, \text{ or } \frac{7}{8} = \frac{1}{8} \text{ of } 7, \text{ or } 7 \div 8$$

Find $\frac{7}{8}$ of 24.

$$\begin{aligned} \frac{7}{8} \text{ of } 24 &= 7 \text{ times } \frac{1}{8} \text{ of } 24 = 7 \times \frac{1}{8} \text{ of } 24 \\ &= 7 \times 3 = 21 \end{aligned}$$

We use the word "of" for multiplication

Thus $\frac{7}{8} \times \frac{5}{7}$ is read $\frac{7}{8}$ of $\frac{5}{7}$.

Find $\frac{7}{8}$ of $\frac{5}{7}$.

$$\frac{7}{8} \text{ of } \frac{5}{7} = \frac{7 \times 5}{8 \times 7} = \frac{35}{56}$$

To find $\frac{7}{8}$ of any number we divide the number into 8 equal parts and take 7 of them. To find $\frac{7}{8}$ of $\frac{5}{7}$ we

Reducing to the lowest terms we get $\frac{5}{8}$: or

$$\frac{7}{8} \text{ of } \frac{5}{7} = \frac{7 \times 5}{8 \times 7} = \frac{5}{8}$$

divide $\frac{5}{7}$ into 8 parts, obtaining $\frac{5}{8 \times 7}$, and taking 7 of these we get $\frac{7 \times 5}{8 \times 7} = \frac{35}{56}$

Rule: To multiply a fraction by a fraction, multiply the numerators together for the new numerator and multiply the denominators together for the new denominator.

Reduce the new fraction to its lowest terms by cancelling factors common to denominator and numerator.

Example:

Multiply $6\frac{2}{3}$ by $7\frac{4}{5}$.

$$6\frac{2}{3} = \frac{20}{3}$$

$$7\frac{4}{5} = \frac{39}{5}$$

$$\frac{13}{5} \quad 4$$

$$7\frac{4}{5} \times 6\frac{2}{3} = \frac{39}{5} \times \frac{20}{3} = \frac{39}{5} \times \frac{20}{3} = 52$$

Example:

Find the value of : $\frac{3}{4}$ of $\frac{8}{9} \times \frac{15}{16}$

$$\frac{3}{4} \text{ of } \frac{8}{9} \times \frac{15}{16} = \frac{3 \times 8 \times 15}{4 \times 9 \times 16}$$

By cancellation.

$$\frac{\overset{2}{3} \times \overset{5}{8} \times 15}{\underset{3}{4} \times 9 \times \underset{8}{16}} = \frac{5}{8}$$

ALICQUOT PARTS

Introductory.

25 cents is contained in \$1.00 exactly *four times*, or

$$$.25 = $\frac{1}{4}$ of $1.00$$

$$25 = \frac{1}{4} \text{ of } 100$$

$$250 = \frac{1}{4} \text{ of } 1000$$

The following relations are evident :

$$20 = \frac{1}{5} \text{ of } 100$$

$$12\frac{1}{2} = \frac{1}{8} \text{ of } 100$$

$$33\frac{1}{3} = \frac{1}{3} \text{ of } 100$$

$$16\frac{2}{3} = \frac{1}{6} \text{ of } 100$$

$$50 = \frac{1}{2} \text{ of } 100$$

$$66\frac{2}{3} = \frac{2}{3} \text{ of } 100$$

25, 20, 50, $33\frac{1}{3}$, $12\frac{1}{2}$, $16\frac{2}{3}$, $66\frac{2}{3}$ are *aliquot parts* of 100.An *aliquot part* of a number is a part that divides that number exactly.*Multiplying by the method of aliquot parts.*

$$25 \times 36 = \frac{1}{4} \text{ of } 100 \times 36 = \frac{1}{4} \text{ of } 3600 = 900$$

or $25 \times 36 = \frac{1}{4} \text{ of } 36 \times 100 = 9 \times 100 = 900$

$$33\frac{1}{3} \times 18 = \frac{1}{3} \text{ of } 100 \times 18 = \frac{1}{3} \text{ of } 1800 = 600$$

or $33\frac{1}{3} \times 18 = \frac{1}{3} \text{ of } 18 \times 100 = 6 \times 100 = 600$

ORAL EXERCISE

Division of Fractions

To divide a fraction by a whole number :

Introductory.

$$\frac{1}{2} \text{ of } 4 \text{ ninths} = 2 \text{ ninths}$$

$$\frac{1}{2} \text{ of } \frac{4}{9} = \frac{2}{9}, \text{ or } \frac{4}{9} \div 2 = \frac{2}{9}$$

$$\frac{1}{2} \text{ of } 6 \text{ elevenths} = 3 \text{ elevenths}$$

$$\frac{1}{2} \text{ of } \frac{6}{11} = \frac{3}{11}, \text{ or } \frac{6}{11} \div 2 = \frac{3}{11}$$

$$\frac{1}{3} \text{ of } 6 \text{ sevenths} = 2 \text{ sevenths}$$

$$\frac{1}{3} \text{ of } \frac{6}{7} = \frac{2}{7}, \text{ or } \frac{6}{7} \div 3 = \frac{2}{7}$$

Multiplying the denominator of $\frac{6}{7}$ by 3, we have the result $\frac{6}{21}$.

Reducing $\frac{6}{21}$ to its lowest terms, we get the fraction $\frac{2}{7}$.

Comparing $\frac{6}{7 \times 3}$ with $\frac{6}{7} \div 3$, we see that the results are the same.

Rule. — To divide a fraction by a whole number, divide the numerator of the fraction or multiply the denominator of the fraction, by the whole number.

EXERCISE

Find the value of the following :

1. $\frac{8}{9} \div 2$

6. $\frac{10}{17} \div 5$

11. $11\frac{1}{4} \div 5$

2. $\frac{12}{15} \div 6$

7. $\frac{14}{36} \div 7$

12. $16\frac{5}{8} \div 19$

3. $\frac{14}{17} \div 7$

8. $\frac{2}{9} \div 8$

13. $73\frac{1}{2} \div 7$

4. $\frac{3}{4} \div 2$

9. $\frac{20}{25} \div 5$

14. $43\frac{1}{2} \div 47$

5. $\frac{5}{6} \div 3$

10. $\frac{42}{49} \div 7$

15. $353\frac{1}{8} \div 25$

To divide a fraction or a whole number by a fraction.

Example:

Divide $\frac{2}{3}$ by $\frac{5}{7}$.

$$\frac{2}{3} \div \frac{5}{7} = (\frac{2}{3} \times \frac{7}{5}) \div (\frac{5}{7} \times \frac{7}{5})$$

Since multiplying dividend and divisor by the same number does not change the value of the quotient:

$$\begin{aligned} & \left(\frac{2}{3} \times \frac{7}{5}\right) \div \left(\frac{5}{7} \times \frac{7}{5}\right) \\ &= \frac{2}{3} \times \frac{7}{5} \div 1 = \frac{14}{15} \div 1. \\ & \frac{14}{15} = \frac{2 \times 7}{3 \times 5}. \end{aligned}$$

That is, to divide by $\frac{5}{7}$ invert the fraction and multiply.

Rule. — Any number may be divided by a fraction by inverting the terms of the fraction which is the divisor, and multiplying.

Example:

Divide $2\frac{3}{4}$ by $1\frac{1}{2}$.

$$\begin{aligned} 2\frac{3}{4} &= \frac{11}{4} & 1\frac{1}{2} &= \frac{3}{2} \\ 2\frac{3}{4} \div 1\frac{1}{2} &= \frac{11}{4} \div \frac{3}{2} \\ &= \frac{11}{4} \times \frac{2}{3} = \frac{22}{12} = \frac{11}{6} = 1\frac{5}{6} \end{aligned}$$

Example:

Divide 48 by $1\frac{3}{5}$.

$$\begin{aligned} 1\frac{3}{5} &= \frac{8}{5} \\ 48 \div 1\frac{3}{5} &= 48 \div \frac{8}{5} \\ &= 48 \times \frac{5}{8} = \frac{48 \times 5}{8} = 30 \end{aligned}$$

EXERCISE

Divide:

- | | | |
|-------------------------|---|---|
| 1. 10 by $\frac{5}{7}$ | 5. $\frac{3}{4}$ by $\frac{7}{12}$ | 9. $9\frac{3}{4}$ by $\frac{9}{10}$ |
| 2. 18 by $\frac{3}{8}$ | 6. $\frac{15}{17}$ by $\frac{9}{16}$ | 10. $7\frac{5}{24}$ by $12\frac{8}{13}$ |
| 3. 30 by $\frac{6}{7}$ | 7. $\frac{13}{14}$ by $\frac{7}{15}$ | 11. $21\frac{3}{7}$ by $12\frac{8}{21}$ |
| 4. 40 by $3\frac{1}{2}$ | 8. $\frac{185}{288}$ by $\frac{15}{22}$ | 12. $45\frac{3}{5}$ by $2\frac{6}{9}$ |

Find the quotients:

13. $16\frac{2}{3} \div 14\frac{1}{2}$

17. $\frac{5}{8} \div 12\frac{3}{4}$

14. $62\frac{1}{2} \div 16\frac{2}{3}$

18. $\frac{7}{10} \div 16\frac{4}{5}$

15. $87\frac{1}{2} \div 37\frac{1}{2}$

19. $15\frac{7}{8} \div 3\frac{1}{4}$

16. $28\frac{4}{7} \div \frac{25}{49}$

20. $\frac{5}{9} \div 3\frac{2}{7}$

CHAPTER VIII

DECIMALS

Introductory :

1. Read the number 2,345,678. In this number name the place occupied by each figure in the number.
2. Read the number 11,111. Name the place occupied by each figure in the number.
3. What part of the ten is the unit?
What part of the hundred is the ten?
What part of the thousand is the hundred?
What part of the ten thousand is the thousand?
4. The ten is how many times the unit?
The hundred is how many times the ten?
The thousand is how many times the hundred?
The ten thousand is how many times the thousand?
5. How are the units related to the tens?
How are the tens related to the hundreds?
How are the hundreds related to the thousands?
How are the thousands related to the ten thousands?
6. How are the tens related to the units?
How are the hundreds related to the tens?
How are the thousands related to the hundreds?
How are the ten thousands related to the thousands?
7. If we begin at the units place and move the figure one place to the left, what do we do to the number? Take, for example, 4. If we move it *one* place to the left, we get 40, that is, we multiply 4 by 10.
8. If we begin at the units place and move the figure two places to the left, what do we do to the number? Take, for example, 7. If we move it *two* places to the left, we get 700, that is, we multiply by 100.

9. Moving the figure *three* places to the left multiplies the number by 1000. Moving the figure *four* places to the left multiplies the number by 10,000.

10. Let us take the number 60,000. If we move the 6 *one* place to the right, we get 6000. We have divided by 10.

11. Let us move the 6 *two* places to the right, we have 600. We have divided by 100.

12. If we move the figure *three* places to the right, we divide by 1000. If we move the figure *four* places to the right, we divide by 10,000.

The *ten* is ten times the unit.

The *hundred* is ten times the ten and 100 times the unit.

The *thousand* is 10 times the hundred, 100 times the ten, and 1000 times the unit.

The *ten thousand* is ten times the thousand, 100 times the hundred, 1000 times the ten, and 10,000 times the unit.

10 is 10 times the unit.

100 is 100 times the unit.

1000 is 1000 times the unit.

10,000 is 10,000 times the unit.

The unit is one-tenth of the ten.

The unit is one-hundredth of the hundred; the ten is one-tenth of the hundred.

The unit is one-thousandth of the thousand; the ten is one-hundredth of the thousand; the hundred is one-tenth of the thousand.

The unit is one-ten-thousandth of the ten thousand; the ten is one-thousandth of the ten thousand; the hundred is one-hundredth of the ten thousand; and the thousand is one-tenth of the ten thousand.

By writing a figure one place to the right, we take one-tenth of the number. For example, 5 is $\frac{1}{10}$ of 50.

By writing a figure two places to the right, we take one-hundredth of the number. For example, 5 is $\frac{1}{100}$ of 500.

By writing a figure three places to the right, we take one-thousandth of the number. For example, 5 is $\frac{1}{1000}$ of 5000.

By writing a figure four places to the right, we take one-ten-thousandth of the number. For example, 5 is $\frac{1}{10,000}$ of 50,000.

Read the following :

\$5.65	\$235.75	\$65.25	\$4756.15
\$1.50	\$1.25	\$1.10	\$1.40

In these numbers we notice that the cents are written with the dollars, but we use a dot to separate the cents and the dollars.

We write 10 cents	\$.10	25 cents	\$.25
5 cents	\$.05	20 cents	\$.20
50 cents	\$.50	70 cents	\$.70

10 cents is one-tenth of a dollar and is written \$.10.

1 cent is one-hundredth of a dollar and is written \$.01.

30 cents is three-tenths of a dollar and is written \$.30.

7 cents is seven-hundredths of a dollar and is written \$.07.

Read the fractions $\frac{1}{10}$, $\frac{1}{100}$, $\frac{1}{1000}$, $\frac{1}{10,000}$.

These fractions stand for parts of one or the unit.

If we write down the unit 1, we may write down one-tenth of this by writing it one place to the right of the unit.

Thus :

UNIT	ONE-TENTH
1	$\frac{1}{10}$

We may write down one-hundredth by moving two places to the right of the unit.

Thus:

UNIT	TENTH	HUNDREDTH
1	0	1

In the same way we may write down the thousandth and the ten-thousandth.

Thus:

UNIT	TENTH	HUNDREDTH	THOUSANDTH	TEN-THOUSANDTH
1	0	0	1	1

If, then, we have to the right of the unit place the tenth, hundredth, thousandth, ten-thousandth, and other places, we may write down in this form fractions having 10, 100, 1000, 10,000, etc. as denominators.

Example:

Write down $46\frac{7}{10}$, $8\frac{56}{100}$, $23\frac{562}{1000}$, $75\frac{39}{10,000}$.

HUNDREDS	TENS	UNITS	TENTHS	HUNDREDTHS	THOUSANDTHS	TEN-THOUSANDTHS
	4	6	7			
		8	5	6		
	2	3	5	6	2	
	7	5	0	0	3	9

We see, therefore, that we may write fractions having as denominators 10 or a power of 10 by using the same system as for whole numbers but we write the fractional part to the right of the units. In order that we may not have to write out the names of the fractional places after the units, we place a small dot at the right side of the units to indicate the units place; thus to write 3 units we write 3.

This small dot placed after the units indicates the units place and shows where the fractional part of the number begins.

We write $\frac{6}{10}$ thus 0.6.

$\frac{7}{100}$ thus 0.07.

There being 0 units we place 0 in

$\frac{36}{100}$ thus 0.36.

the units place.

$\frac{763}{1000}$ thus 0.763.

The following chart shows the place value of figures in integers and decimals :

hundred-thousands	ten-thousands	thousands	hundreds	tens	units	.	tenths	hundredths	thousandths	ten-thousandths	hundred-thousandths
9	8	7	6	5	0	.	5	6	7	8	9

The units place should be regarded as the central place, and the decimal point is used to indicate the units position. The integers or whole numbers are written to the left of the units, and the fractional parts or decimals are written to the right of the units. By reference to the chart we notice the following symmetry :

One place to the left of units is tens ; one place to the right is tenths.

Two places to the left of units is hundreds ; two places to the right is hundredths.

Three places to the left of units is thousands ; three places to the right is thousandths.

Note. — The integral part of the whole number ends in *s* ; the fractional part of the decimal ends in *ths*. For example, tens, tenths ; hundreds, hundredths ; thousands, thousandths.

In reading decimal fractions to the right of the decimal

point, we read them as whole numbers and give them the name of the place of the last figure.

For example: Read 0.6 ; 0.78 ; 0.06 ; 0.034 ; 0.008.

0.6 is read six-tenths.

0.78 is read seventy-eight hundredths.

0.06 is read six-hundredths.

0.034 is read thirty-four thousandths.

0.008 is read eight thousandths.

In writing decimals it is not necessary always to write the 0 in the units ; it is understood that there are 0 units.

In reading a number made up of an integral and a decimal part, we usually separate the fractional part by using the word *and*.

For example: 456.0563 is read, four hundred fifty-six *and* five hundred sixty-three ten-thousandths.

Note. — We may have decimal fractions of the hundred-thousandth, millionth, ten-millionth, hundred-millionth, etc. order. It is not usual to use the decimal fraction much beyond the 4th place or the ten-thousandths order.

Reading and Writing Decimals

Examples:

1. Read the decimal .563. The name of the order of the right-hand figure is thousandths. The decimal is read five hundred sixty-three *thousandths*.

2. Read the decimal .00563. The name of the order of the right-hand figure is hundred-thousandths. The decimal is read five hundred sixty-three *hundred-thousandths*.

3. Read 53.078. The name of the order of the right-hand figure of the decimal is thousandths. Read the

whole number and separate the decimal part with the word *and*. The number is read thus: fifty-three *and* seventy-eight *thousandths*.

Reduction of Common Fractions to Decimal Fractions

*Example:*Reduce $\frac{5}{8}$ to a decimal fraction. $\frac{5}{8}$ indicates the division of 5 by 8.

5 units are not divisible by 8, but we may reduce the units to tenths, obtaining 50 tenths.

50 tenths divided by 8 will give us 6 tenths and 2 tenths over.

We may reduce the 2 tenths to hundredths, obtaining 20 hundredths.

20 hundredths divided by 8 will give us 2 hundredths and 4 hundredths over.

We may reduce the 4 hundredths remainder to thousandths, obtaining 40 thousandths.

40 thousandths divided by 8 will give 5 thousandths.

Writing down our quotients we have: 6 tenths, 2 hundredths, 5 thousandths, or .625.

The work may be shortened thus:

$$\begin{array}{r} 0.625 \\ 8 \overline{)5.000} \end{array}$$

Rule. — To reduce a common fraction to a decimal fraction, place the decimal point to the right of the numerator, annex zeros, and divide by the denominator of the fraction, placing the decimal point in the quotient.

*Example:*Reduce $\frac{5}{6}$ to a decimal fraction.

$$\begin{array}{r} .833 \\ 6 \overline{)5.000} \end{array} \quad \text{2 remainder}$$

In this case the division is not exact. The division is usually carried out to 3 or 4 places only, and the remainder is neglected.

EXERCISE

Addition of Decimals

Introductory :

Add 457, 6543, 24, 12,345.

To add these we write them down thus :

457
6543
24
12345

19369

In adding, we first add the units, then tens, and so on until the sum is completed.

Example :

Add 34.67, 236.08, 5.007, 64.8.

34.67
236.08
5.007
64.8

340.557

Arrange these under each other, placing units under the units, tens under tens, etc., tenths under tenths, hundredths under hundredths, etc. Add figures of the same order : put down the sum, and carry to the next higher order. Begin at the right-hand column of the addition.

Subtraction of Decimals

Example: From 45.43 take 7.684.

45.430 Write down the numbers as in ordinary subtraction,
 7.684 taking care that the decimal points are in the same
37.746 column and that figures of the same order are placed
 under each other, units under units, etc.

Begin at the right-hand figure.

Since the first figure in the subtrahend is thousandths, annex a zero to the minuend making a thousandth place in it. Subtract as with whole numbers, placing the decimal point of the answer under the decimal points above.

Multiplication of Decimals

Introductory.

Examples:

1. Multiply 436 by .6.
2. Multiply 546 by 4.03.
3. Multiply 65.4 by 3.8.
4. Multiply .045 by .073.

1. Multiply 436 by .6.

$$436 \times .6 = 436 \times \frac{6}{10} = \frac{2616}{10} = 261\frac{6}{10} = 261.6$$

$$\begin{array}{r} 436 \\ \times .6 \\ \hline 261.6 \end{array}$$

2. Multiply 546 by 4.03.

$$546 \times 4.03 = 546 \times 4\frac{3}{100} = 546 \times \frac{403}{100}$$

$$= \frac{220038}{100} = 2200\frac{38}{100} = 2200.38$$

$$\begin{array}{r} 546 \\ \times 4.03 \\ \hline 1638 \\ 21840 \\ \hline 2200.38 \end{array}$$

3. Multiply 65.4 by 3.8.

$$65.4 \times 3.8 = 65\frac{4}{10} \times 3\frac{8}{10} = \frac{654}{10} \times \frac{38}{10}$$

$$= \frac{24852}{100} = 248\frac{52}{100} = 248.52$$

$$\begin{array}{r} 65.4 \\ \times 3.8 \\ \hline 5232 \\ 19620 \\ \hline 248.52 \end{array}$$

4. Multiply .045 by .073.

$$.045 \times .073 = \frac{45}{1000} \times \frac{73}{1000} = \frac{3285}{1000000} \\ = .003285$$

$$\begin{array}{r} .045 \\ .073 \\ \hline 135 \\ 315 \\ \hline .003285 \end{array}$$

Study carefully the foregoing examples.

Compare the product in each case. We find that it is made up by multiplying the numbers together as in ordinary multiplication. The number of decimal places in the product is equal to the sum of the number of places in the multiplier and the multiplicand.

Rule. — Multiply as in the case of whole numbers. Mark off as many places of decimals in the product as there are in the multiplicand and multiplier together.

Introductory.

1. Divide 3468 by 4.

$$\begin{array}{r} 867 \\ 4 \overline{)3468} \end{array}$$

Note. — We place the figure of the quotient above the corresponding figure of the dividend.

2. Divide 34.7620 by 4.

$$\begin{array}{r} 8.6905 \\ 4 \overline{)34.7620} \end{array}$$

3. Divide 2356.784 by 8.

$$\begin{array}{r} 294.598 \\ 8 \overline{)2356.784} \end{array}$$

4. Divide .00384 by 8.

$$\begin{array}{r} .00048 \\ 8 \overline{).00384} \\ \underline{.0} \\ 0 \\ \underline{0} \\ 38 \\ \underline{32} \\ 64 \\ \underline{64} \end{array}$$

4. .678	3.098	.2345	0.56

ORAL EXERCISE

Read aloud the following numbers :

By what must we multiply each of the following numbers in order to make them whole numbers or integers ?

	<i>a</i>	<i>b</i>	<i>c</i>	<i>d</i>	<i>e</i>	<i>f</i>
1.	34.6	.876	0.056	43.09	6.008	345.04

5.	0.00985	0.0305	18.305	327.602	13.050	0.9008

To divide a decimal by a decimal.

Introductory.

1. Divide 4624 by 8. *Quotient*, 578.

Multiply both dividend and divisor by the same numbers, and divide.

Multiplying both dividend and divisor by 9, we have
41,616 divided by 72. *Quotient*, 578.

Multiplying both dividend and divisor by 10, we have
46,240 divided by 80. *Quotient*, 578.

2. Divide 76,531 by 7. *Quotient*, 10,933.

Multiply both dividend and divisor by the same numbers.

Multiplying both dividend and divisor by 8, we have
612,248 divided by 56. *Quotient*, 10,933.

Multiplying both dividend and divisor by 10, we have
765,310 divided by 70. *Quotient*, 10,933.

Note. — If we multiply both dividend and divisor by the same number, the value of the quotient remains the same.

Example:

Divide 48.96 by .8.

We have learned how to divide by 8. If then we change the divisor to 8, we may proceed with the division. To change the divisor to 8 we multiply by 10. If the divisor is multiplied by 10, the dividend must be multiplied by the same number in order that the quotient may be the same.

Hence 48.96 divided by .8 is the same as

489.6 divided by 8. *Quotient, 61.2.*

Example:

Divide 51.43 by .37.

Make the divisor a whole number by multiplying by 100. Multiply the dividend by 100. Proceed as in ordinary division.

$$\begin{array}{r}
 139. \\
 37 \overline{)5143} \\
 \underline{37} \\
 144 \\
 \underline{111} \\
 333 \\
 \underline{333} \\
 0
 \end{array}$$

Example:

Divide .07928 by .04.

$$\begin{array}{r}
 1.982 \\
 4 \overline{)7.928} \\
 \underline{4} \\
 39 \\
 \underline{36} \\
 328 \\
 \underline{320} \\
 80 \\
 \underline{80} \\
 0
 \end{array}$$

Example:

Divide 36 by .025.

The decimal point is not written at the end of a whole number, but it may be regarded as coming after the units.

We annex zeros to the dividend to make up the number of places, thus :

36,000 divided by 25.

$$\begin{array}{r}
 1440 \\
 25 \overline{)36000} \\
 \underline{25} \\
 110 \\
 \underline{100} \\
 100 \\
 \underline{100} \\
 00
 \end{array}$$

Example :

Divide .0005691 by .07.

Multiplying both dividend and divisor by 100, we have
.05691 divided by 7.

$$\begin{array}{r}
 .00813 \\
 7 \overline{).05691}
 \end{array}$$

EXERCISE

Divide :

8. .0113391 by 3.87	18.496 by .512	.03931822 by .967

<i>a</i>	<i>b</i>	<i>c</i>
9. 1.10643 by 0.039	0.0058893 by 0.067	.5214227 by .0893
10. 3294.2808 by 4.37	0.001032152 by 0.0296	312.7194 by 3.78

If the division is not exact, carry out the quotient to 3, 4, or 5 places of decimals.

CHAPTER IX

DENOMINATE NUMBERS AND APPLICATIONS

What unit of measure does the grocer use in measuring the sugar he sells? What unit of measure does the dry goods merchant use in selling cloth? What unit of measure does a farmer use in measuring the amount of grain he has? What unit of measure does the dairyman use in selling milk? What unit of measure do you use in finding the amount of money you have?

What is the unit, and how often is the unit repeated in 8 feet? in 4 ounces? in 6 dozen? in 20 cents? in 3 gallons? in 2 hours?

Measuring a quantity is the process of finding how many times the fixed unit of that quantity is contained in it.

The concrete numbers, 8 feet, 4 ounces, etc., in which the unit of measure has a fixed value established by law or custom, are called *denominate numbers*.

A denominate number composed of units of only one denomination, as 2 feet, 4 tons, 5 hours, is called a *simple denominate number*.

A denominate number containing units of two or more denominations each of which may be expressed in terms of the other, as 3 feet 4 inches, 5 hours 30 minutes, 2 gallons 3 quarts, is called a *compound denominate number*.

Canadian Money

Canadian money is the legal currency of the Dominion of Canada. It consists of *dollars*, *cents*, and *mills*.

The *dollar* is the unit and is denoted by the symbol \$.

$\begin{aligned} 10 \text{ mills} &= 1 \text{ cent} \\ 100 \text{ cents} &= \$1 \end{aligned}$
--

In writing a sum of money dollars are separated from cents by a *point*. Thus \$6.75 is read six dollars and seventy-five cents. Any number of cents less than ten, when written with dollars, occupies the second place to the right of the *point*, and the first place to the right of the point is occupied by a zero. Thus 4 dollars and five cents is written \$4.05. The mill is one-tenth of a cent and is written one place to the right of the cents. Thus, \$3.775 is read 3 dollars, 77 cents, and 5 mills.

The present silver coins of the Dominion are the fifty-cent piece, the twenty-five cent piece, the ten-cent piece, and the five-cent piece. The one-cent piece is made of copper. The mill is not coined and is used only in certain computations.

ORAL EXERCISE

1. How many cents are there in \$3.16? in \$4.25? in \$2.05? in \$9.50? in \$10.05?
2. How many cents are equal to a five-dollar bill? to a dollar bill and 25 cents? to a ten-dollar bill and 10 cents? to a two-dollar bill and 5 cents?
3. How many cents are there in one dollar and a half? in one dollar and a quarter? in five dollars and a half?

4. How many dollars and cents are there in 375 cents? in 525 cents? in 910 cents? in 1025 cents? in 605 cents?

5. How many two-dollar bills are equal to 600 cents? to 800 cents? to 1000 cents?

6. How many ten-cent pieces are there in \$2? in \$3? in \$5?

7. How many cents are equal to 3 ten-dollar bills? to two five-dollar bills? to 4 ten-dollar bills?

8. How many five-cent pieces are there in \$2? in one dollar and a half? in two dollars and a quarter?

Reduction.

The process of changing the units of one denomination to units of another denomination of a denominate number without changing its value is called *reduction*.

Which is the unit of greater value, \$1 or 1 cent? Which is the unit of greater weight, 1 pound or 1 ounce? Which is the unit of greater length, 1 foot or 1 yard?

Changing a given unit to a smaller unit is called *reduction to a lower denomination*, or *reduction descending*.

Changing a given unit to a larger unit is called *reduction to a higher denomination*, or *reduction ascending*.

EXERCISE

Reduce to cents, and read :

1. \$5; \$7.36; \$17.04.

2. \$29.18; \$414.36; \$200.09.

British, or Sterling Money

4 farthings (far.)	= 1 penny (1d.)
12 pence	= 1 shilling (1s.)
20 shillings	= 1 pound (£1)

Table of Weight — Avoirdupois Weight

16 drams (dr.)	= 1 ounce	(oz.)
16 ounces	= 1 pound	(lb.)
100 pounds	= 1 hundredweight	(cwt.)
20 hundredweight	= 2000 pounds	= 1 ton (T.)

The ton of 2000 lbs. is sometimes called the *short ton* to distinguish it from a ton of 2240 lbs. called a *long ton*, which is frequently used in weighing mining products. In Great Britain the long ton is used, and 1 cwt. = 112 lbs., also 14 lbs. = 1 stone.

ORAL EXERCISE

- How many ounces are there in 2 lbs.? in 1 lb. 8 oz.? in 3 lbs. 4 oz.?
- How many pounds are there in 32 oz.? in 20 oz.? in 48 oz.? in 40 oz.?

The measure of capacity is used in measuring *liquids*, water, milk, oil, alcohol, etc., and *dry articles*, grain, fruit, roots, lime, etc. In measuring liquids the peck and bushel measures are not used, but these are used in measuring dry articles. The gallon, containing 10 pounds of distilled water, is the standard measure of capacity. Its capacity is 277.274 cubic inches.

A cubic foot of water weighs 1000 oz., or $62\frac{1}{2}$ lb.

A cubic foot contains $6\frac{1}{4}$ gallons.

But leap year coming once in four
February then has one day more.

Circular, or Angular Measure

Circular or angular measure is used to measure the size of circles and angles.

There are 360 degrees (360°) in the circumference of a circle and therefore 90° in a quarter of the circumference. This part of the circumference lies between the arms of a right angle at the centre of the circle.

The right angle AOB (Fig. 2) is also measured in degrees (90°).

A part of the circumference is called an *Arc*. The arc of

the circumference cut off by the arms of a right angle at the centre is called a *Quadrant*.

In Figure 3 what part of the circumference is each arc? What part of 360° is each angle at the centre?

In Figure 4 what part of the circumference is each arc? What part of 360° is each angle at the centre?

If two lines (radii) are drawn joining the ends of an arc to the centre of the circle, there will be just as many degrees in the angle formed as there are degrees in the arc.

A purchaser frequently does not pay cash for goods bought at a store, but a record of the purchases is kept by the firm. These purchases are to be paid for at the end of the month or at such time as is agreed upon. The record of the purchases and payments is called an *account*.

All records of the purchases, which to the purchaser are a debt, are called *debts* and are placed in one column of the account.

All records of money received from the purchaser on his account are called *credits* and are placed in another column of the account.

Farm Accounts

Every farmer finds it necessary to keep accurate accounts of his business transactions. Without such accurate accounts he cannot tell whether he is carrying on his farming operations at a profit or at a loss. He may find, for instance, that certain crops that he is growing are not yielding him a profit, as he thinks, but are actually causing a loss.

In order to find out the standing of his business, a merchant takes an inventory of his stock at least once a year. The farmer does the same. A farm inventory includes the value of the land, buildings, stock, machinery, grain, hay, household effects, cash in bank, Victory bonds, money loaned, etc. The values should be based on local market values.

FARM INVENTORY

480 acres of land and buildings at \$40 per acre	\$19,200.00
4 horses, aged, at \$120 each	480.00
3 horses, 4 yr. old, at \$180 each	540.00
